7. Quick Reference

1. What is ReqAgent?

ReqAgent is an AI-powered requirements intake and tracking platform. It eliminates the manual documentation work that Business Analysts perform every time a stakeholder submits a business requirement — writing user stories, MoSCoW classification, priority scoring, conflict detection, and traceability documentation.

In a traditional process, one requirement takes 6–8 hours to fully document. With ReqAgent, the same work is completed in under 30 minutes, with the AI generating structured output within 10 seconds of submission.

The Four Pages

- Submit Requirement — structured intake form; AI generates all documentation automatically
- Requirements Tracker — full lifecycle management from Submitted through Done
- Traceability Matrix — always-current mapping of requirements to user stories; downloadable as CSV
- Analytics Dashboard — real-time KPI metrics, charts, and pipeline health indicators

Time Savings

Task	Manual Process	With ReqAgent
Write 3 user stories	60–90 minutes	Under 10 seconds
Write acceptance criteria	30–45 minutes	Under 10 seconds
MoSCoW classification	15–30 minutes	Automatic
Conflict detection	30–60 min (often missed)	100% automated on every submission
Traceability matrix	90–120 min to maintain	Always current, instant CSV download
Total per requirement	6–8 hours	20–30 minutes

2. How It Works — The End-to-End Flow

Every requirement follows the same automated pipeline from submission to structured output in the database.

1	Stakeholder submits form The stakeholder fills out the intake form with title, description, department, role, and business objective, then clicks Submit.
2	Raw intake saved to MongoDB The submission is stored in MongoDB Atlas exactly as written. This is the permanent, unmodified source of truth.
3	Existing requirements retrieved The system retrieves all existing requirements from MongoDB to give the AI context for conflict detection.
4	AI processes the requirement Grog's LLaMA 3.3 70B receives a structured prompt and generates user stories, acceptance criteria, MoSCoW classification, priority justification, and a conflict report.
5	Priority hardcoded by role After AI processing, the priority is set based on submitter role. C-Suite → High. End User → Low. The AI cannot override this.
6	Structured output saved to Postgres User stories, acceptance criteria, MoSCoW, priority, and conflict data are saved to Neon Postgres for lifecycle tracking and reporting.
7	Results displayed to user The full AI analysis appears on screen within 10 seconds. The requirement is now live in the Tracker and Traceability Matrix.

3. Page 1 — Submit Requirement

The starting point for every requirement in the system. Any stakeholder fills out this structured form. The AI handles all documentation automatically within 10 seconds of submission.

REQUIREMENTS INTAKE

Submit a Business Requirement

Fill out the form below. The AI will automatically generate user stories, acceptance criteria, MoSCoW classification, and conflict detection.

Requirement Title *

e.g. Customer Purchase History Dashboard

Your Role *

C-Suite / Executive

Department *

Sales

Business Objective *

e.g. Improve sales rep efficiency before customer calls

Your Name *

e.g. John Smith

Requirement Description *

Describe the business need in as much detail as possible. What problem are you solving? Who is affected? What does success look like?

Additional Notes (Optional)

Any constraints, deadlines, dependencies, or context that might be relevant.

Submit & Generate AI Analysis

Figure 2 — The Submit Requirement form showing all required fields

Form Fields

Requirement Title *	A short, clear name for the requirement. Becomes the identifier throughout the system — in the Tracker, Matrix, and Analytics.
Your Role *	Directly determines the priority score. C-Suite and VP → High. Department Head and Team Lead → Medium. End User and External → Low. Cannot be overridden by the AI.
Department *	The submitting department. Used in the Analytics department breakdown chart.
Business Objective *	The business goal this requirement serves. Helps the AI generate more relevant user stories.
Your Name *	Submitter's name. Appears in the Tracker and Traceability Matrix for accountability.
Requirement Description *	The most important field. The richer the description, the better the AI output. Describe the problem, who is affected, and what success looks like.
Additional Notes	Constraints, deadlines, dependencies, or context. Optional but improves AI accuracy.

Priority Scoring Logic

Role	Priority	MoSCoW
C-Suite / Executive	High	Must Have
VP / Director	High	Must Have
Department Head / Manager	Medium	Should Have
Team Lead	Medium	Should Have
End User	Low	Could Have
External Stakeholder	Low	Could Have

4. Page 2 — Requirements Tracker

The central hub for Business Analysts and Project Managers. All submitted requirements appear as expandable cards that can be filtered, updated, and reviewed.

Figure 3 — The Requirements Tracker showing 22 requirements with filter controls

Filters

Filter by Status	Show only requirements at a specific lifecycle stage.
Filter by Priority	Show only High, Medium, or Low priority requirements.
Filter by MoSCoW	Show only Must Have, Should Have, Could Have, or Won't Have requirements.

Figure 4 — An expanded requirement card showing badges, submitter info, and status controls

Lifecycle Stages

Status	Meaning
Submitted	Initial state. Requirement submitted and AI analysis is complete.
Under Review	A Business Analyst is reviewing the AI output and validating the need.
Approved	Approved and ready to be added to the development backlog.
In Development	Engineering is actively building this requirement.
Done	Fully implemented and delivered.
Rejected	Reviewed and will not be implemented in its current form.

Figure 5 — Status dropdown showing all 6 lifecycle options

Full Details View

Clicking 'View Full Details' reveals three additional sections:

- User Stories — all 3 AI-generated stories with full Given/When/Then acceptance criteria
- Audit Trail — every status change logged with old status, new status, and exact timestamp
- Original Intake (MongoDB) — the raw description exactly as submitted, unmodified

Figure 6 — User stories, acceptance criteria, and audit trail

5. Page 3 — Traceability Matrix

An automatically maintained document linking every requirement to its user stories and acceptance criteria. Always current — no manual updating required. Filterable and downloadable as CSV in one click.

Figure 7 — The Traceability Matrix showing all requirements and user stories

Understanding the Row Count

The matrix shows one row per user story, not per requirement. Since ReqAgent generates 3 stories per requirement, 22 requirements produce 66 rows. Each row is a direct traceable link between a business requirement and a specific user story.

Columns

REQ ID	Auto-generated identifier in REQ-XXXX format. Unique per requirement.
Title	The requirement title as submitted by the stakeholder.
Submitted By	Name of the person who submitted the requirement.
Department	The department the requirement came from.
Status	Current lifecycle status with color-coded badge.
Priority	High, Medium, or Low with color-coded badge.
MoSCoW	Must Have, Should Have, Could Have, or Won't Have with color-coded badge.
User Story	The AI-generated user story (first 120 characters shown in table view).

Filters and Export

Filter by Status	Narrow the matrix to a specific lifecycle stage. Useful for reporting on approved requirements only.
Filter by MoSCoW	Narrow to a specific classification. Useful for sprint planning and release scoping.
Download as CSV	Exports the full matrix with all filters applied. Includes complete user stories and acceptance criteria — not truncated. Can be imported into Excel, Jira, or any project management tool.

6. Page 4 — Analytics Dashboard

Real-time visibility into the requirements pipeline. All metrics and charts update automatically as requirements are submitted or statuses change. No manual reporting required.

Figure 8 — KPI metrics and status/MoSCoW distribution charts

KPI Metrics

Total	Count of all requirements across all statuses and departments.
Approved	Count of requirements in Approved status — validated and ready for development.
In Development	Count of requirements actively being built by engineering.
Done	Count of requirements fully implemented and delivered.
High Priority	Count of High priority requirements — submitted by C-Suite or VP roles.
Must Have	Count of Must Have requirements — non-negotiable for any release.

Figure 9 — Department and priority breakdown charts

Charts

Requirements by Status	Donut chart showing the percentage breakdown at each lifecycle stage.
MoSCoW Breakdown	Donut chart showing Must Have, Should Have, Could Have, Won't Have distribution.
By Department	Horizontal bar chart showing submissions per department, each with a distinct color.
By Priority	Bar chart showing High, Medium, Low split — color-coded red, amber, green.
Submission Timeline	Area chart showing requirements submitted over time. Tracks intake velocity.

Submissions by Role	Bar chart showing submissions per role — identifies whether demand is leadership or end-user driven.
